Writing VMs using PyPy

Maciej Fijałkowski, Alex Gaynor, Armin Rigo

Qualcomm 2012

8 March 2012

What is PyPy?

- a fast Python interpreter with a JIT
- a framework to write dynamic language interpreters
- an open source project on the BSD license
- an agile project with contributors from all over the world

A bit about the architecture

- describe your VM in a high level language
- implement your object model, types etc.
- you get a GC and JIT for free
- with a few hints for the JIT

A bit about the architecture

- describe your VM in a high level language
- implement your object model, types etc.
- you get a GC and JIT for free
- with a few hints for the JIT

PyPy's architecture

- RPython program, imported and initialized
- transformed to control flow graphs
- compiled do C -OR- JVM -OR- graphs for JIT
- this is a very high-level overview

JIT architecture

- works on the level of the interpreter
- by design complete
- from a single source code of the interpreter
